Chapter 6

Optical Storage Media

7.1. Communication Architecture

Scope

Basic Technology (cont..)

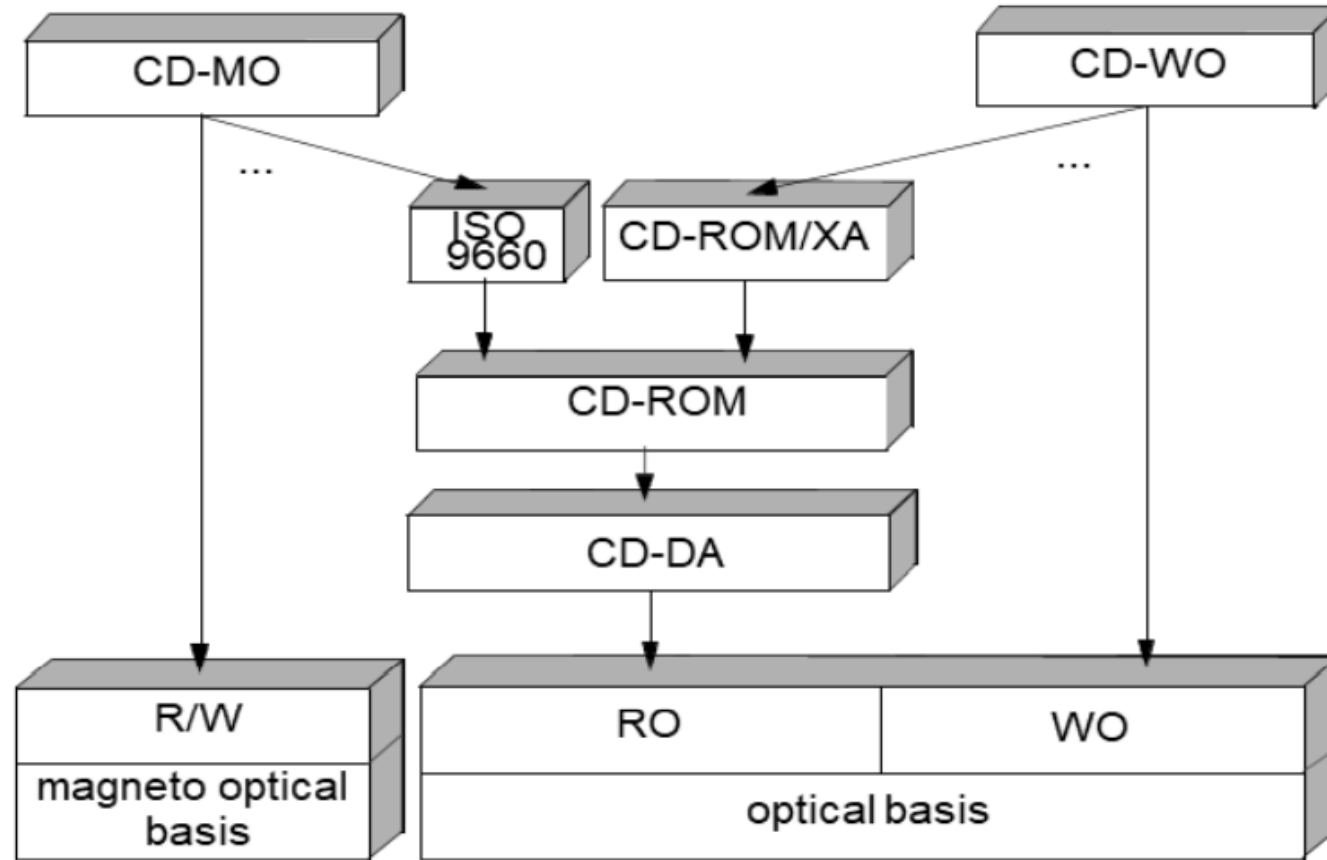

- ❖ Optical storage is the storage of data on an optically readable medium.
- ❖ Data is recorded by making marks in a pattern that can be read back with the aid of light, usually a beam of laser light precisely focused on a spinning optical disc.
- ❖ Optical storage, electronic storage medium that uses low-power laser beams to record and retrieve digital (binary) data.
- ❖ In optical-storage technology, a laser beam encodes digital data onto an optical, or laser, disk in the form of tiny pits arranged in concentric tracks on the disk's surface

Basic Technology (cont..)

- ❖ Optical storage media offer a higher storage density at a lower cost.
- ❖ Current magnetic data storage carriers take the form of floppy disks or hard disks and are used as secondary storage media.
- ❖ An optical disc drive is a device in a computer that can read CD-ROMs or other optical discs, such as DVDs and Blu-ray discs.
- ❖ Optical storage differs from other data storage techniques that make use of other technologies such as magnetism, such as floppy disks and hard disks, or semiconductors, such as flash memory and RAM.

Basic Technology (cont..)

Compact Disc and in addition Digital Versatile/Video Disk

Basic Technology (cont..)

History

1973	Video Long Play (VLP) - published
1983	Compact Disc Digital Audio (CD-DA) - available: <ul style="list-style-type: none">• Red Book Standard

Fundamentals

Fig. :Data on a CD as an example of an optical disk (track with 'lands' and 'pits').

Fundamentals

- ❖ Magnetic disks is that on the former 1.66 data bits per μm can be stored.
- ❖ This results in a data density of 1,000kbits per mm^2 , which implies 16,000 tracks per inch.
- ❖ In comparison, a floppy disk has 96 tracks per inch.

Fundamentals

Pits and Lands

Information is stored in a spiral-shaped track:

- Series of pits and lands in substrate layer
- Transition from pit to land and from land to pit: „1“
- Between transitions: sequence of „0“ s
- 16000 turns/inch (tpi)

Laser focused onto reflective layer

- Lands - almost totally reflecting
- Pits - scattering

Fundamentals

Fundamentals: Physical Structure

Cross-section through disc in direction of spiral track:

3 layers:

- Transparent substrate layer
- Reflective layer
- Protective layer

Fundamentals

Fundamentals: Read Data

Laser focused onto reflective layer:

- Lands - almost totally reflecting
- Pits - scattering

Advantages of Optical Storage Media

High data density:

- 1.66 data bits / μm of track
- 16000 tpi \Leftrightarrow floppy disk: 96 tpi

Long term storage:

- Protection of data
- Surface out of focus  insensitivity to dust, scratches

Low probability of head crashes:

- Distance between head and substrate surface $> 1\text{mm}$

Adequate error correction

Each digital disc is equivalent to the master

CD-ROM (manufactured)

CD-R (burned)

Laser Vision : Fundamentals

❖ Characteristics:

- Storage of video and audio
- Analogue encoding
- High quality of reproduced data
- Diameter: 30 cm
- Storage capacity: 2.6 G Byte

❖ History:

- Originally Video Long Play (VLP)
- 1973 first description in Philips Technical Review

Laser Vision : Fundamentals

Principles:

- Mix of audio and video
- Frequency modulation
- No quantization of pit length

Cross section through a Laser Vision disc:

Compact Disk Digital Audio

- ❖ An Audio CD is a music CD like that you buy in a music store.
- ❖ It can be played on any standard CD player (such as a CD deck, or your car CD player, or a portable CD player).
- ❖ Music is stored on Audio CDs as uncompressed digital data, no data is lost and quality is very high, exactly as in WAV(Waveform Audio File Format, WAVE) digitally encoded files.
- ❖ When you put an Audio CD into your personal computer CD player and play it, audio is extracted on the fly and played by your PC sound hardware.
- ❖ Compact Disc Digital Audio(CDDA or CD-DA) is the standard format for audio compact discs.

Compact Disk Digital Audio (CD-DA)

Storage of audio data

History:

- ❖ Development of basic technology by N. V. Philips
- ❖ Cooperation of N. V. Philips and Sony Corporation
- ❖ 1983 CD-DA available Physical characteristics:
- ❖ Diameter: 120 mm
- ❖ Constant linear velocity (CLV), i.e. number of rotations/s depends on position of head relative to disc center
- ❖ Track shape: One spiral with appr. 20000 turns

Compact Disk Digital Audio (CD-DA) : Physical Characteristics

Data Structure

- ❖ The audio data stream in an audio CD is continuous, but has three parts.
- ❖ The main portion, which is further divided into playable audio tracks, is the program area. This section is preceded by a lead-in track and followed by a lead-out track.
- ❖ The lead-in and lead-out tracks encode only silent audio, but all three sections contain sub coded data streams.
- ❖ The lead-in's subcode contains repeated copies of the disc's Table Of Contents (TOC), which provides an index of the start positions of the tracks in the program area and lead-out.

Data Structure

- ❖ The track positions are referenced by absolute time code, relative to the start of the program area, in MSF format: minutes, seconds, and fractional seconds called frames. Each time code frame is one seventy-fifth of a second, and corresponds to a block of 98 channel-data frames— ultimately, a block of 588 pairs of left and right audio samples.
- ❖ Time code contained in the sub channel data allows the reading device to locate the region of the disc that corresponds to the time code in the TOC.

CD – DA characteristics

- Audio data rate:

- Sampling frequency: 44100Hz
- 16 bit quantization (Each audio sample is a signed 16-bit two's complement integer, with sample values ranging from -32768 to $+32767$.)
- Pulse code modulation (PCM)
- Audio data rate = $1411200 \text{ bit/s} = 176,4 \text{ Kbyte/s}$

- Quality:

- Signal to noise ratio (S/N):
- $\sim 6\text{dB/bit}$, 16 bit quantization \Rightarrow S/N exactly 98 dB
- LP, tape: S/N 50-60 dB

- Capacity: (without error correction data)

- Playback time: maximal 74 min
- Capacity = $74 \text{ min} * 1411200 \text{ bit/s} = 6265728000 \text{ bit} \sim 747 \text{ MByte}$

CD – DA : Pits and Land

Length of pits: multiples of 0.3μm

Coding:

- ❖ Transition from pit to land / from land to pit: “1”
- ❖ Between transitions: sequence of “0” s.

CD-DA: Eight-to-Fourteen Modulation

- Eight-to-fourteen modulation modifies binary code data and allows 17 bits of data space to be used to encode 8 bits of data.
- The 8-bit block of data is replaced by a 14-bit codeword using a lookup table.
- This requires more space for data, but assures that imperfections and foreign material do not cause critical data to be missed by the optical pickup in the playback mechanism.
- This involves two extra zeros placed between two consecutive ones. Consistently applied, the data can be read accurately even with the disc imperfections and foreign material present.
- For DVDs and SACDs, a channel code called EFM Plus is used, which translates 8-bit words into 16-bit code words. This results in a 6.25% increase in storage capacity above that achieved by classic EFM.

CD-DA: Eight-to-Fourteen Modulation

Example for a code conversion table:

data bits	channel bits
00000000	01001000100000
00000001	10000100000000
...	...

Concatenation of independent 14 bit values
Í potential violation of:

- Min. distance of 2 bits
- Max. distance of 10 bits

Three additional *merging bits*

CD-DA: Eight-to-Fourteen Modulation Example

CD-DA: Eight-to-Fourteen Modulation

CD-DA: Error Handling

Typical Errors:

- Scratches, dust, fingerprints
- "Burst errors"
- To be detected and corrected

Two-level Reed-Solomon Code with frame interleaving:

- First level: byte level, EDC and ECC
 - two groups: each with 4 correction bytes for 24 data bytes
 - first group: correction of single byte errors
 - second group: correction of double byte errors, detection of further errors
- Second level: Frame interleaving
 - frame: 588 channel bits = 24 audio data bytes
 - distribution of consecutive data bytes and corresponding ECC bytes over adjacent frames

CD-DA:

Cross Interleaved Reed Solomon Code

Error rate: 10^{-8} (~ 1bit/100 millions of bits) Exact correction of 4000 data bits possible:

- 4000 data bits * 0.3 μm /channel bit
- ~ 2.5 mm
- Hence: burst errors within 2.5 mm can be corrected

Interpolation:

- Up to 12,300 data bits (~ 7 mm)
- Hence: error within 7mm can be repaired

CD-DA: Frames

Frame consists of:

- Data:
 - 2 groups of 12 audio data bytes each (actual data)
- Error detection and correction code:
 - 2 groups of 4 parity bytes
 - According to Reed-Solomon
- Control & display byte:
 - Together with c&d bytes of other frames it forms subchannel stream
 - E.g., subchannel byte for track start identification
- Synchronization pattern:
 - Start of a frame
 - $12 \times "1" + 12 \times "0" + 3 \text{ merging bits} = 27 \text{ bits}$

CD-DA: Data Streams

Audio bit stream ~ 1.41×10^6 bit/s:

- 44,1 kHz sampling frequency ~ 1411200 bit/s
- 16-bit stereo PCM
- Uniform quantization

Data bit stream ~ 1.94×10^6 bit/s:

- Audio bit stream
 - + parity bytes
 - + control & display byte

Channel bit stream ~ 4.32×10^6 bit/s:

- Data bit stream
 - + EFM
 - + merging bits
 - + synchronization pattern

CD-DA: Areas

Areas:

- Lead-in area:
 - List of contents
 - Indication to start of each track
- Program area:
 - Up to 99 tracks of different lengths
 - Typically one track relates to one song
- Lead-out area

Random Access:

- Tracks
- Index points:
 - IP_0 : start of track
 - IP_1 : start of audio data
 - Track pregap: part between IP_0 and IP_1

CD-DA: Summary

Provides:

- Suitable means for typical errors caused by damage, dust in audio data
- CD-DA specification is base for family of optical storage media

But:

- Not conceived for:
 - video (different ECC, EDC scheme required)
 - discrete data (error rate too high)
- Desired: simultaneous play back of various media

Compact Disc Read Only Memory (CD-ROM) and Extended Architecture

- A CD-ROM is a pre-pressed optical compact disc which contains data.
- Computers can read CD-ROMs, but cannot write to CDRoms, which are not writable or erasable.

Compact Disc Read Only Memory (CD-ROM) and Extended Architecture

Storage of:

- Data, audio, compressed audio and video

Yellow Book CD-ROM Standard:

- CD-ROM mode 1: for any data
- CD-ROM mode 2: for compressed audio and video data
- But can not be combined on single track

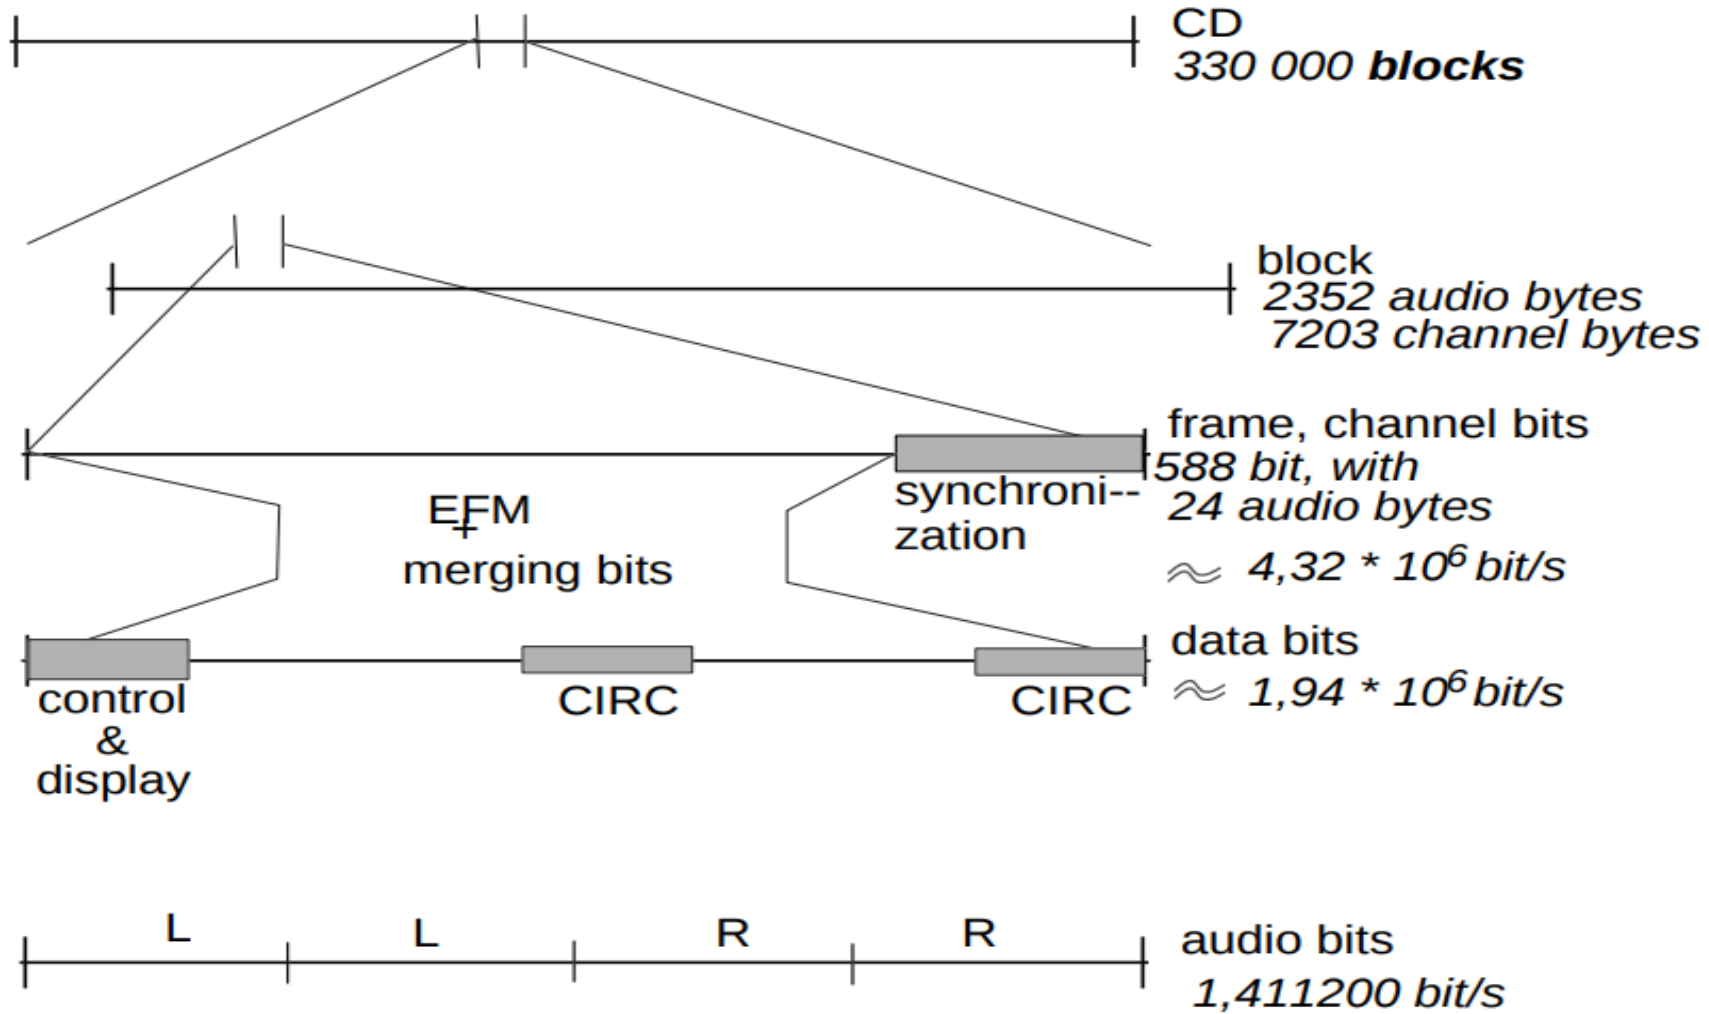

Within single track:

- Only CD-DA audio or only CD-ROM specific data

Mixed Mode Disc:

- Data tracks at the beginning
- Subsequent tracks for audio data

Compact Disc Read Only Memory (CD-ROM) and Extended Architecture

Compact Disc Read Only Memory (CD-ROM) and Extended Architecture

Fine granularity for random access:

- Tracks, IP not sufficient
- Structure with a higher resolution: block
- Blocks with fixed number of frames

Some numbers:

- 1 block = 32 frames
- 75 blocks/s (for single-speed CD-ROM)
- $1411200 \text{ bit/s} / 75 \text{ blocks/s} / 8 \text{ bit/byte} = 2352 \text{ byte/block}$

Allows for:

- Random access
- Better EDC, ECC

CD-ROM Mode 1

- 4 bytes for the header, which carries an unambiguous (definite) specification of the block.
 - The first byte stores minutes, the second byte stores seconds and the third byte contains the block number. The fourth byte includes the mode specification.
- 2,048 bytes for the user data.
- 4 bytes for error detection.
- 8 unused bytes.
- 276 bytes for error correction. Hence, an error rate of 10^{-12} can be achieved

CD-ROM Mode 1 (cont..)

- A CD-ROM contains 333,000 blocks to be played in 74 minutes. The capacity of a CD-ROM with all blocks in mode 1 can be computed as follows

$$\begin{aligned} \text{Capacity}_{CD-ROM_{mode1}} &= \\ &= 333,000 \text{ blocks} \times 2048 \frac{\text{bytes}}{\text{block}} = 681,984,000 \text{ bytes} \\ &= 681,984,000 \times \frac{1}{1024 \frac{\text{bytes}}{\text{Kbyte}}} \times \frac{1}{1024 \frac{\text{Kbytes}}{\text{Mbyte}}} \approx 660 \text{ Mbytes} \end{aligned}$$

The *data rate* in mode 1 is:

$$\begin{aligned} \text{Rate}_{CD-ROM_{mode1}} &= \\ &= 2,048 \frac{\text{bytes}}{\text{Block}} \times 75 \frac{\text{Blocks}}{\text{s}} = 153.6 \frac{\text{Kbytes}}{\text{s}} \equiv 150 \frac{\text{Kbytes}}{\text{s}} \end{aligned}$$

CD – ROM Mode 1

1 block = 2352 byte:

- Header bytes include minutes, seconds, block number, mode
- Error rate = 10^{-12}

Capacity:

- Max. 74 min x 60 s/min x 75 block/s = 333000 blocks
- 333000 blocks/CD ~ 650 MByte (user data)

Data rate:

- 2048 byte/block x 75 block/s ~ 150 KByte/s (single-speed)

Used by most CD-ROM applications

CD – ROM Mode 2

1. Additional error correction does not exist. The capacity and data rate of a CD-ROM with all blocks in mode 2 can be computed as follows:

$$Capacity_{CD-ROM_{mode2}} = 333,000 \text{ blocks} \times 2336 \frac{\text{bytes}}{\text{block}} \approx 777,888,000 \text{ bytes}$$

$$Rate_{CD-ROM_{mode2}} = 2336 \frac{\text{bytes}}{\text{block}} \times 75 \text{ blocks/s} \approx 175.2 \text{ Kbytes/s}$$

CD – ROM : Average Access Time

CD-ROM: Average Access Time

Time to position a block/sector:

- Synchronization time:
 - Adapt internal clock to disc signal
 - Range of milliseconds
- Seek time:
 - Adaptation of laser to radius: max. 1s
- Rotation delay (for constant velocity time):
 - Find sector within 1 rotation
 - Adapt disk speed
 - ~ 300 ms

⬆ Maximum access time > 1s

⬆ Average access time > 300ms (with data caching)

- Simultaneous reading of audio and other data in CD-ROM mode 1 not possible

CD – ROM : File System

CD-ROM: File System

CD-ROM:

- No logical file format
- No directory specification

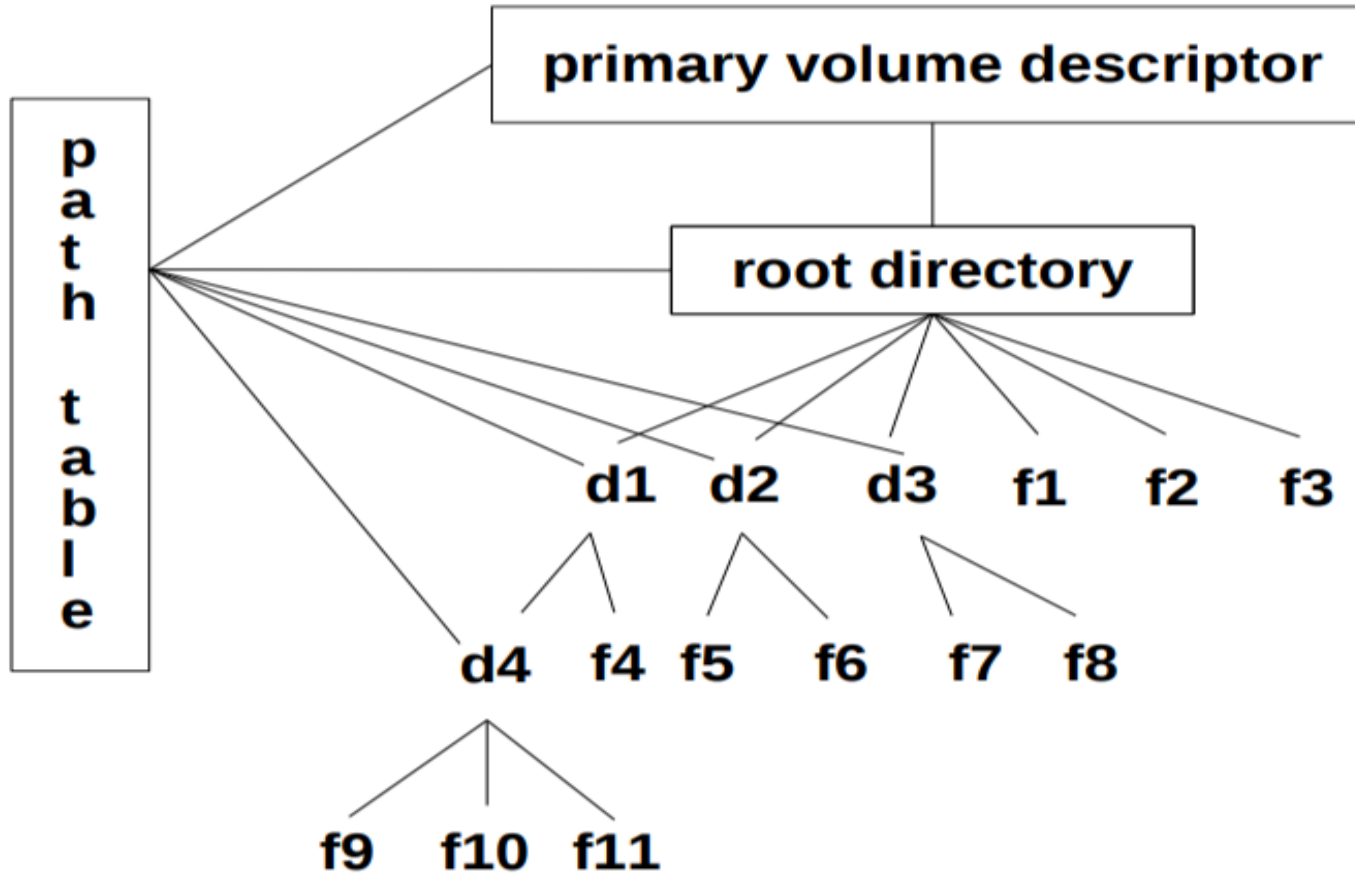

High Sierra Proposal:

- Developed by group of industry representatives
- Initial file system leading to ISO 9660

ISO 9660 file standard:

- Directory tree: information about files
- Path table:
 - List of all directories
 - Direct access to files of any level
- File interleaving

CD – ROM : File System - Path

ISO 9660 File System

First track:

- 16 blocks (sectors 0 to 15): system area
- Volume descriptors in subsequent blocks:
 - Primary descriptor:
 - Length of file system
 - Length and address of path table
 - Supplementary descriptors
- Volume descriptor terminator

Logical block size:

- Between 512 byte and 2048 byte (in steps of 2ⁱ)
- Blocks of 512 byte, 1024 byte, and 2048 byte are used
- Files begin at logical block start

CD-ROM Extended Architecture (CDROM / XA)

History:

- N.V. Philips, Sony and Microsoft (announcement in 1988)

Goal:

- Simultaneous transfer of various media data

Characteristics:

- Based on CD-ROM mode 2, ISO 9660, CD-I
- Extension of Yellow Book standard
- Interleaving of blocks of different media within the same track
- Definition of a new type of track used for:
 - compressed audio (ADPCM) and video data
 - images
 - text, programs
- Distinction between two block formats: „Form 1“, „Form 2“

CD-ROM / XA (Mode 2) Form 1

Subheader:

- Specification of CD-ROM Mode 2 XA-Format type
- 8 bytes

Improved error handling for:

- Text
- Program data

By:

- 4 byte for error detection
- 276 byte for error correction

CD-ROM / XA (Mode 2) Form 1

CD-ROM / XA (Mode 2) Form 2

- Storage of compressed data (incl. audio, video)
- Only 4 bytes for error detection
- 13% more data bytes

CD-ROM / XA: Audio

	CD audio	level B stereo	level B mono	level C stereo	level C mono
compr. ratio	1	4:1	8:1	8:1	16:1
coding techn.	PCM	ADPCM	ADPCM	ADPCM	ADPCM
sampling freq.	44100 Hz	37800 Hz	37800 Hz	18900 Hz	18900 Hz
capacity	74 min	4 h 48 min	9 h 36 min	9 h 36 min	19 h 12 min
data rate	176 kByte/s	43 Kbyte/s	22 Kbyte/s	22 Kbyte/s	11 Kbyte/s

CD-ROM / XA: Drawbacks

Compatibility to audio and video compression

- For some media only reference to standard
 - coding / decoding not part of CD technology
- MPEG audio not compatible (MPEG does not use ADPCM)

Interleaved storage of data of different types in the same track:

- Requires special disc layout
- Requires effective interleaving with choice of suitable audio level
- Complex application development

CD-Interactive (CD-I)

History:

- ❖ Developed by Philips and Sony
- ❖ 1986 CD-I announcement
- ❖ 1988 Green Book: CD-I extension based on Red and Yellow Book
- ❖ Originally for consumer market

CD-I system:

- ❖ CD-ROM based format with interleaving of different media
- ❖ Compression algorithms
- ❖ Software (operating system)
- ❖ Hardware (decoder) Different quality levels Low data rates

CD-Interactive (CD-I) : Software and Hardware

CD-I Software with CD-RTOS operating system:

- ❖ CD-RTOS operating system is an extension of OS/9
- ❖ Real-time capabilities

CD-I Hardware (decoder):

- ❖ System board:
 - ❖ 680xx processor
 - ❖ Video-, audio –chips
- ❖ CD player with CD-DA components
 - ❖ Mouse or joystick interface
 - ❖ CD controller
 - ❖ Connection to RGB monitor or TV
 - ❖ Replacement of CD-DA
 - ❖ Size of a video recorder

CD-Interactive (CD-I) : Software and Hardware

CD-I: Audio

	CD digital audio	CD-I „A“ hi-fi music	CD-I „B“ mid-fi music	CD-I „C“ speech
sampling rate	44.1 kHz	37.8 kHz	37.8 kHz	18.9 kHz
freq. range	20 kHz	17 kHz	17 kHz	8.5 kHz
encod.	16 bit PCM	8 bit ADPCM	4 bit ADPCM	4 bit ADPCM
s/n ratio	98 dB	90 dB	60 dB	60 dB
max. playing time	74 min stereo	2.4 h stereo 4.8 h mono	4.8 h stereo 9.6 h mono	9.6 h stereo 19.2 h mono
appr. fidelity equival.	CD	mono LP	mono FM	mono AM

CD-Interactive (CD-I) : Video

Coding of still images at different qualities and resolutions:

- ❖ Different amount of data
- ❖ Different data rates

YUV mode:

- ❖ Reproduction of natural images with many colors
- ❖ Encoding of changes of luminance and chrominance values
- ❖ 360 x 240 pixel, 18 bit/pixel
- ❖ 262144 colors
- ❖ $360 * 240 * 18 \text{ bit/image} = 194400 \text{ byte/image}$

Animations with few colors:

- ❖ Run-length encoding, about 10000 to 20000 Byte/image

MPEG for video encoding

CD-Interactive (CD-I) : Video

Color Look-Up Table (CLUT):

- ❖ 4 bit/pixel (3.7 or 8 bit/pixel)
- ❖ For simple graphics fast data read-out
- ❖ Predefined color table
- ❖ 720 x 240 pixel, 16 colors
- ❖ $720 * 240 * 4 \text{ bit} = 86400 \text{ Byte/image}$

RGB mode:

- ❖ For very good graphics
- ❖ 5 bit/pixel for each component
- ❖ $15 \text{ bit/pixel} + 1 \text{ additional bit/pixel} = 16 \text{ bit/pixel}$
- ❖ 360 x 240 pixel/image, 65538 colors
- ❖ $360 * 240 \text{ pixel/image} * 16 \text{ bit/pixel} = 172800 \text{ Byte/image}$

CD-Interactive (CD-I) : Ready Format

CD that can be played in CD-DA and CD-I players:

- ❖ Track pre gap:
 - ❖ Contains CD-I specific information
 - ❖ Increased from 2-3 s to at least 182s
- ❖ Audio players ignore the track pregap information and play only audio data part

Three different modes of play:

- ❖ Standard audio playback:
 - ❖ Track pre gap information is ignored and only audio data played
- ❖ Reading, display and interpretation of the pre gap data:
 - ❖ Audio data part is ignored
- ❖ Displaying pre gap data as audio is played:
 - ❖ First step: loading CD-I information into player's RAM memory
 - ❖ Second step: start playing audio and information display

Principle of CD-Write and CD Magneto optical

CD-Write Once

- ❖ So far, all of the CD technologies considered do not allow the user to write to the disk. Thus, the application scope is limited.
- ❖ This has led research laboratories to develop, besides the Read Only Storage Media, compact disks that can be recorded once or several times.
- ❖ The compact Disk write once (CD-WO), like WORM (write once Read Many), allows the user to write once to a CD and afterwards to read it many times.

Principle of CD-WO

Principle of the CD-WO

Figure 7.12: *Cross-section of a CD-WO disk.*

Principle of CD-WO

- ❖ Figure shows a cross-section of a CD-WO, vertical to the disk surface and data track.
- ❖ In the case of read-only CDs, the substrate (a polycarbonate) lies directly next to the reflection layer.
- ❖ In the case of a CD-WO, an absorption layer exists between the substrate and the reflection layer. This layer can be irreversibly (permanently) **modified through strong thermal influence**, which changes the reflection properties of the laser beams.

Principle of CD-WO

- ❖ In its original state, a CD-WO player recognizes a track consisting of lands.
- ❖ The absorption layer in the pre-grooved track is heated to above 2500 C with a laser three to four times the intensity of a reading player. Hence, the absorption layer changes such that the reflection of the laser light now corresponds to a pit.
- ❖ This method determines the most remarkable property of the CD-WO: its data can be played by any devices which are meant only for read-only CDs.

Principle of CD-Write and CD Magneto optical

Compact Disk Magneto Optical

- ❖ The Compact Disk Magneto Optical (CD-MO) has a high storage capacity and allows one to write multiple times to the CD.

Principle of the Magnetic-Optical Method

- The magnetic-optical method is based on the polarization of the magnetic field where the polarization is caused by a heat.
- To be written, the block (sector) is heated to above 150 °C. Simultaneously, a magnetic field approximately 10 times the strength of the earth's magnetic field is created.
- The individual dipoles in the material are then polarized according to this magnetic field.
- Hereby, a pit corresponds to a low value of the magnetic field. A land is coded through a high value of the magnetic field.

Principle of the Magnetic-Optical Method

- ❖ After the CD is irradiated (illuminated) with a laser beam, the polarization of the light changes corresponding to the existing magnetization. Using this process, the read operation is executed.
- ❖ For a delete activity, a constant magnetic field is created in the area of a block and the sector is simultaneously heated.

Areas of the CD-MO

- ❖ A CD-MO consists of an optional read-only area and a write-many (recordable) area.
- ❖ The read-only area (the premastered area) includes data which were written in a specified format onto the disk.
- ❖ CD-MO read-only area can be read by available playback devices.

Other Storage Media; DVD, Flash Drive, HD Cards, USB

DVD Also known as:

❖ “Digital Versatile Disk”

Goal:

❖ Create a new optical media to store an entire high

Technical overview of DVD:

CD-like optical storage media

- same size as CD => allows for backward compatibility of reading devices

Capacity considerably higher than CD

- shorter pit/lands
- tighter tracks
- EFM PLUS error correction scheme: more robust than CD scheme

Formats:

- single-sided single-layer
- single-sided double-layer: laser must switch focus to read both layers
- double-sided: disk must be flipped over to read both sides

DVD

- ❖ The 12 cm type is a standard DVD, and the 8 cm variety is known as a Mini DVD.
- ❖ These are the same sizes as a standard CD and a mini CD, respectively.
- ❖ The capacity by surface area (MiB/cm²) varies from 6.92 MiB/cm² in the DVD-1 to 18.0 MB/cm² in the DVD-18.

DVD

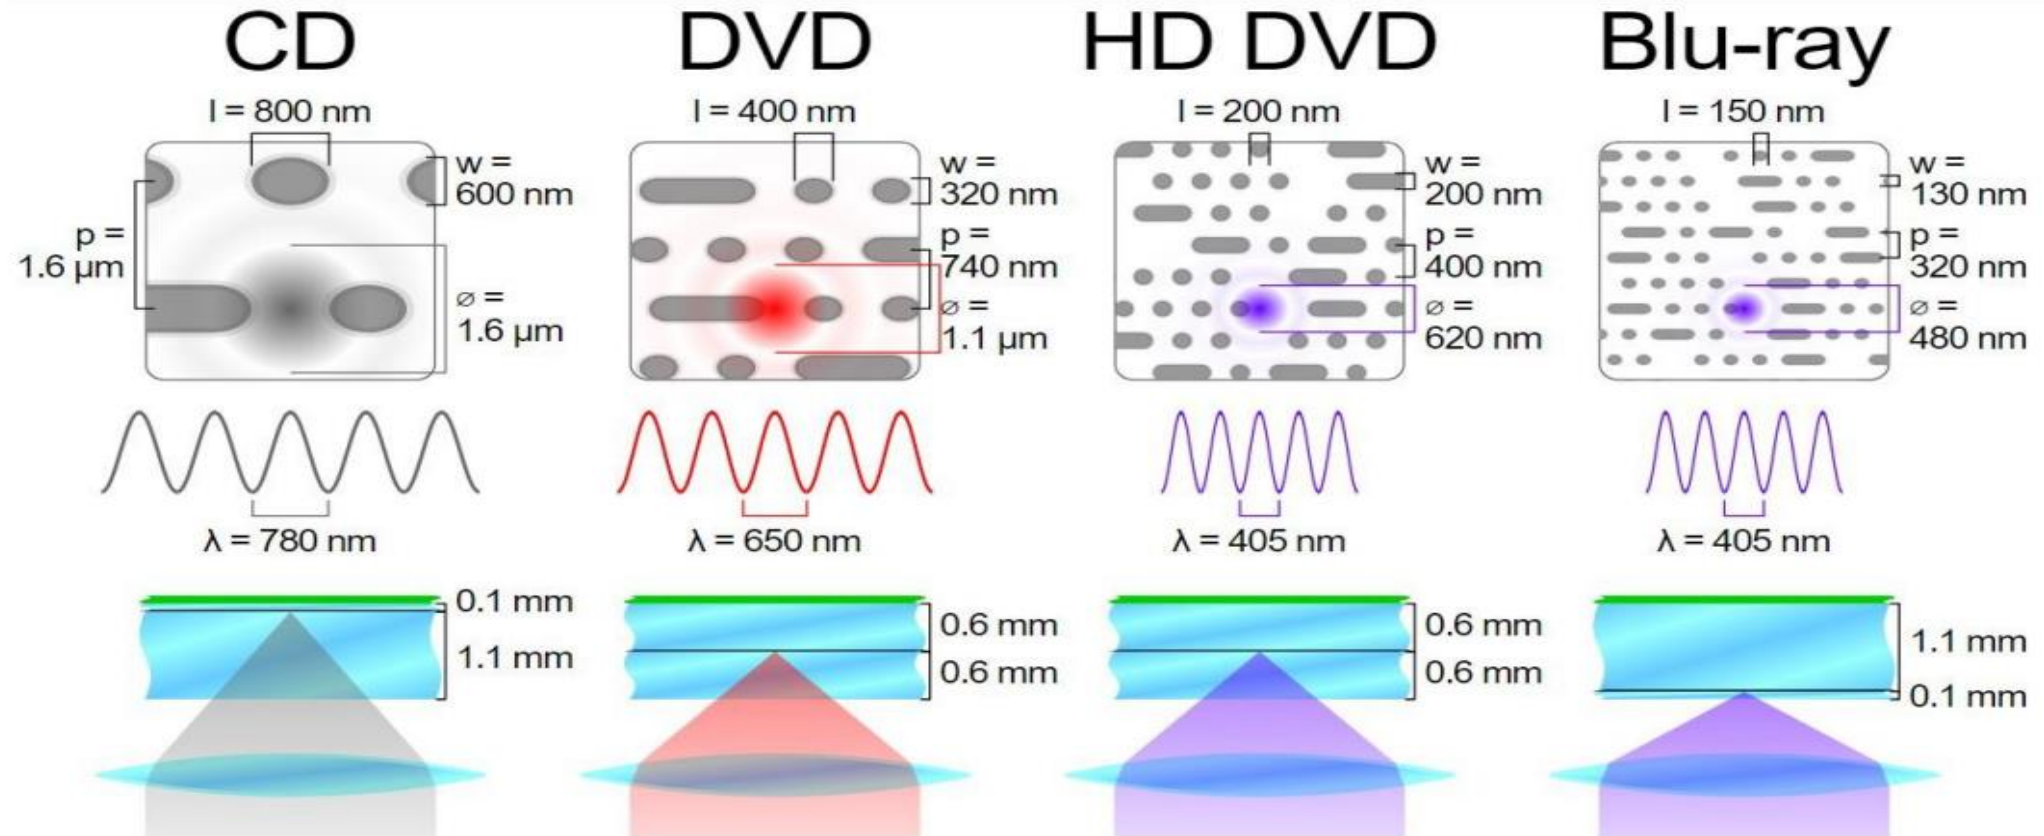

- ✓ Each DVD sector contains 2,418 bytes of data, 2,048 bytes of which are user data.
- ✓ There is a small difference in storage space between + and -(hyphen) formats:
- ✓ Scan of a DVD-R; the "a" portion has been recorded on while the "b" portion has not

DVD

- ✓ A dual-layer disc differs from its single layered counterpart by employing a second physical layer within the disc itself.
- ✓ The drive with dual-layer capability accesses the second layer by shining the laser through the first semitransparent layer.
- ✓ In some DVD players, the layer change can exhibit a noticeable pause, up to several seconds.

DVD

USB Flash Drive

- A USB flash drive, also variously known as a thumb drive, pen drive, gig stick, flash stick, jump drive, disk key, disk on key (after the original M-Systems DiskOnKey drive from 2000), flash drive, memory stick (not to be confused with the Sony Memory Stick), USB stick or USB memory, is a data storage device that includes flash memory with an integrated USB interface.
- Most weigh less than 30 g (1 ounce).
- flash drives with anywhere from 8 to 256 GB are frequently sold; less frequent are 512 GB and 1 TB units.
- USB flash drives are often used for the same purposes for which floppy disks or CDs were once used; i.e. for storage, data backup and transfer of computer files.

USB Flash Drive

- They are smaller, faster, have thousands of times more capacity, and are more durable and reliable because they have no moving parts.
- USB flash drives use the USB mass storage device class standard, supported natively by modern operating systems such as Windows, Linux, macOS and other Unixlike systems, as well as many BIOS boot ROMs.

Memory

- A memory card, flash card or memory cartridge is an electronic flash memory data storage device used for storing digital information.
- These are commonly used in portable electronic devices, such as digital cameras, mobile phones, laptop computers, tablets, etc

Thank you!!!!
